

Embassies and Democracy - Results Only

Steven Pappas and Gregory J. Matthews

2026-05-04

Summary

BROAD QUESTION

Broad question: Does the process of democratization within African countries affect the formulation and implementation of African foreign policies.

THERE ARE THREE DIFFERENT SETS OF STATISTICALLY BASED QUESTIONS (We address only question 1 here):

1. African democracy and African embassies. Do greater levels of democratization of African countries lead to larger and more diversified embassy networks maintained by African countries overseas? Dependent variable: embassies maintained abroad (yes/no by country) in 1965, 1975, 1985, 1995, 2000, 2005, 2010, 2015, 2020, 2025 (use 2024 for 2025).
2. African democracy and African trade. Do greater levels of democratization within African countries lead to larger and more diversified levels of trade imports and trade exports by African countries? Dependent variable: \$ amount of imports and exports annually for 1960 to 2022)
3. African democracy and aid to Africa. Do greater levels of democratization within African countries lead to larger and more diversified levels of foreign aid to African countries? (Dependent variable:\$ amount of aid annually for every country in the world 1960 to 2021).

THUS, THREE DIFFERENT DEPENDENT VARIABLES:

1. Total number and diversification of African embassies maintained abroad.
2. Total amount and diversification of African trade imports and trade exports
3. Total amount and diversification of foreign aid received by African countries

THREE DIFFERENT VARIABLES OF AFRICAN DEMOCRACY AS INDEPENDENT VARIABLE

Three different variables of democracy (each with different inclusive dates) to use separately in the analyses as the independent variable:

1. V-Dem democracy variable (1951-2024) Variable name in the dataset: v2x_LIBDEM. It ranges from 0 (worst) to 1 (best).
2. Polity IV democracy variable (1948-2018) Variable name in the dataset: POLITY. It ranges from -10 (worst) to +10 (best).
3. Freedom House democracy variable (1972 - 2024) Variable name in the dataset: TOTLIB. It ranges from 1 (best) to 14 (worst). It is a combination of the following two variables, which people sometimes run separately: Civil liberties - Variable name in the dataset: -CIVLIB. It ranges from 1 (best) to 7 (worst). -Political rights: Variable name in the dataset: POLLIB. It ranges from 1 (best) to 7 (worst).

For each of the three democracy variables, will do a series of 4 tests with lags. -Test 1. Change in democracy score (no lag) -Test 2. Change in democracy score (1 year lag) -Test 3. Change in democracy score (2 year lag) -Test 4. Change in democracy score (3 year lag)

CONTROL VARIABLES RELATED FOR AFRICAN COUNTRIES (AFRICAN FACTORS)

-African GNI OR GNI per capita (logged?) -African Population (size in millions) - Region of Africa (1= North Africa, 2 = East Africa, 3 = Southern Africa, 4= Central Africa, 5 = West Africa) - African Colonial Past (Colpast2) (1 = French, 2 = British, 3 = Portuguese, 4 = Spanish, 5 = Italian, 6 = Belgian, 7 = German, 8 = United States, 9 = Not colony, 10 = unique) - African Ideology (1 = capitalist, 2 = socialist, 3 = Marxist) - African Historical Period - Entire independence era - Cold War era (1945-1989) - Post-Cold War era (1990-present)

PULL FACTORS—CHARACTERISTICS OF OTHER NON-AFRICAN COUNTRIES OF THE WORLD—JUST FOR THE EMBASSY QUESTION

- Level of democracy (Freedom House)
- Level of democracy (Polity IV)
- Level of democracy (V-dem) These are in the data set for the African countries, but need to be added for the rest of the world.
- GNI
- GNI per capita
- Population
- Imports
- Exports

- Foreign Aid

FOR THE THREE SETS OF STATISTICALLY BASED QUESTIONS, LET'S START WITH THE EMBASSIES (ABOVE QUESTION #1 FIRST)

ANSWERING QUESTION #1

To evaluate this question we first created three sets of reduced and full models. Our reduced models sought to evaluate the relationship and the significance of the relationship between a country's embassy count and its democracy score from Freedom House, Polity IV, and V-dem. In these models, democracy score was the only explanatory variable after controlling for the country and year with random effects. The model equation is given below, where γ_{0k} represents the random effect for country k and γ_{0t} is the random effect for year t . We follow the same setup for the lagged models, which go back as far as three years for each democracy score.

Number of Embassy Models

Reduced Model

$$Y_{kt} \sim \text{Poisson}(\lambda_{kt})$$

$$\log(\lambda_{kt}) = \beta_0 + \beta_1 X_{1kt} + \gamma_{0k} + \gamma_{0t} + \epsilon_{kt}$$

$$\gamma_{0k} \sim N(0, \sigma_k^2)$$

$$\gamma_{0t} \sim N(0, \sigma_t^2)$$

where Y_{kt} is the number of embassies for country k in year t and X_{1kt} is one of the democracy scores for country k in year t . We also considered models where the democracy score as a predictor was lagged by 1, 2, or 3 years (i.e. for a single lag: $\log(\lambda_{kt}) = \beta_0 + \beta_1 X_{1k(t-1)} + \gamma_{0k} + \gamma_{0t} + \epsilon_{kt}$ where $X_{1k(t-1)}$ is the democracy score in the prior year.)

As shown in Table 1, both POLITY and POLITY2 are highly significant (i.e. $p < 0.001$) for all lags. Neither TOTLIB1 nor LIBDEM reaches significance at the $\alpha = 0.05$ confidence level.

Full Model

The full models (results in Table 2) follow a similar setup as the reduced models, but they include additional explanatory variables for the country's GNI, population, region, whether there was a colonial past after World War II, ideology, and whether the year is during the Cold War. We applied log transformations to GNI and population, since they displayed a right-skewed distribution. We also kept the reduced models' random effects for country and year and followed a similar setup for lagged democracy scores, going back as far as three years. The model equation is given below, with k and t again representing country and year, respectively.

$$Y_{kt} \sim \text{Poisson}(\lambda_{kt})$$

$$\log(\lambda_{kt}) = \beta_0 + \beta_1 X_{1kt} + \dots + \beta_7 X_{7kt} + \gamma_{0k} + \gamma_{0t} + \epsilon_{kt}$$

$$\gamma_{0k} \sim N(0, \sigma_k^2)$$

$$\gamma_{0t} \sim N(0, \sigma_t^2)$$

where again Y_{kt} is the number of embassies for country k in year t and X_{1kt} is one of the democracy scores for country k in year t . The additional X s represent a country's GNI, population, region, whether there was a colonial past after World War II, ideology, and whether the year is during the Cold War. We also considered models where the democracy score was lagged by 1, 2, or 3 years (i.e. for a single lag: $\log(\lambda_{kt}) = \beta_0 + \beta_1 X_{1k(t-1)} + \gamma_{0k} + \gamma_{0t} + \epsilon_{kt}$ where $X_{1k(t-1)}$ is the democracy score in the prior year.)

Similar to the reduced models, POLITY and POLITY2 are both significant at all lags with p all lower than 0.01. In the reduced model, the coefficient estimates were between -0.015 and -0.011 across the lags. The full model produces estimates just slightly smaller between -0.01 and -0.009.

Change in Number of Embassy Models

Reduced Model

Next, we sought to evaluate the relationship between a country's yearly change in embassy count by the change in their democracy score. Once again, in this first set of models the random effects for country and year were included. The model equations follow the previously

described reduced model setup, however the response variable here is the change in the number of embassies from one year to the next as opposed to the total number of embassies. To reflect this change, we used a normal model instead of a Poisson model. The details of the normal model are below:

$$\Delta_{kt} \sim \text{Normal}(\mu_{kt}, \sigma^2)$$

$$\log(\mu_{kt}) = \beta_0 + \beta_1 X_{1kt} + \gamma_{0k} + \gamma_{0t} + \epsilon_{kt}$$

$$\gamma_{0k} \sim N(0, \sigma_k^2)$$

$$\gamma_{0t} \sim N(0, \sigma_t^2)$$

where Δ_{kt} is the change in the number of embassies from year $t - 1$ to t , while γ_{0k} , γ_{0t} , and X_{1kt} and are the same as before.

The tables show significance for the unlagged POLITY and POLITY2 and two-year lagged POLITY2 at the $\alpha = 0.05$ confidence level. Their $\hat{\beta}$ coefficients were all negative, indicating that the change in embassy count decreased as these democracy scores increased. Their $\hat{\beta}$ coefficients were -0.151, -0.152, and -0.012, respectively.

Full Model

Next, we sought to evaluate the relationship between a country's yearly change in embassy count by the change in their democracy score while accounting for the variables from our previous full model and random effects for country and year. It is important to note that some models only had realized values for before or after the Cold War, so we removed the Cold War indicator in models where it could not explain any additional variation in our response variable. We commonly observed this in the two-year and three-year lagged models, as their first observed observation was after the Cold War. We also applied the same log transformations to GNI and population to reduce the effect of their right-skew.

The tables show no significance for any of the changes in democracy score at an $\alpha = 0.05$ confidence level, even when accounting for the full range of factors. The closest is the two-year lag for TOTLIB1, with a p of 0.102. Full results are shown in Table 4.

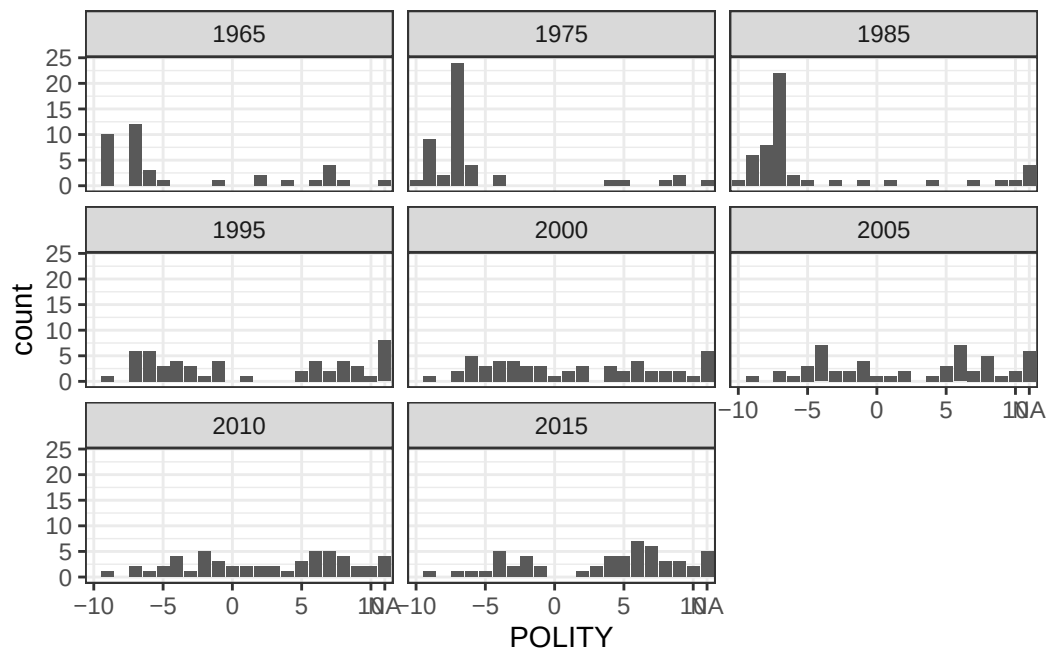

Full Model With Differenced Predictors

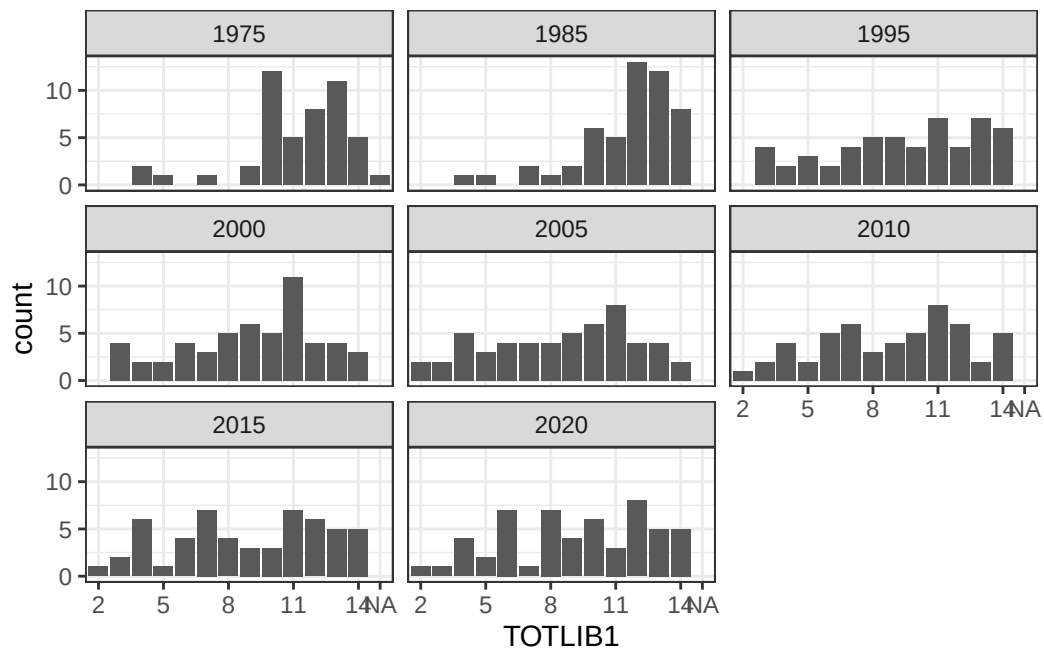

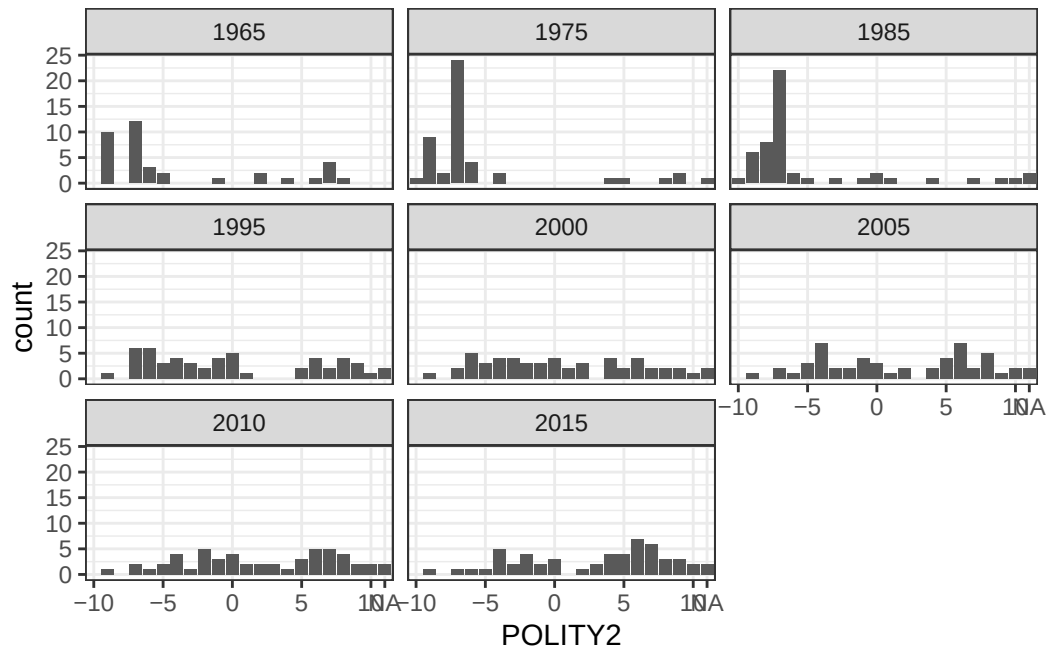

Finally, we replicated the setup from our previous full model but applied the same yearly change from embassy count to the log-transformed GNI and population variables. We lagged only the democracy score, so every other variable matched the year the change in embassy was measured. We kept the same random variables for country and year.

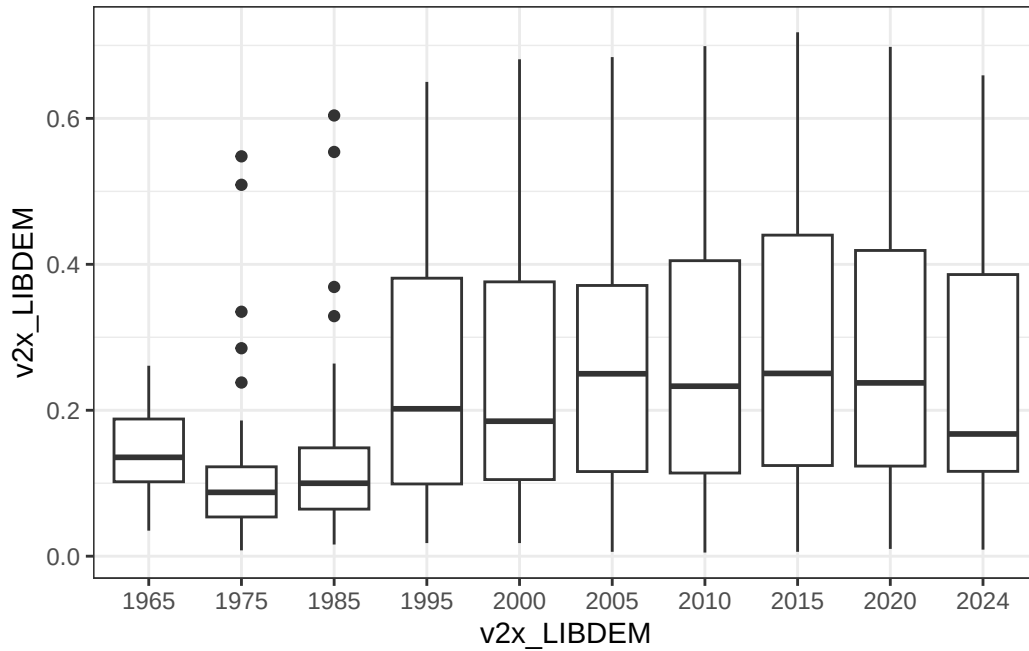

Similar to the previous full model, the tables show no significance for any of the changes in democracy score at an $\alpha = 0.05$ confidence level. The closest is the two-year lagged TOTLIB1, with a p of 0.082. Full results of these models are shown in Table 5.

Exploratory Data Analysis

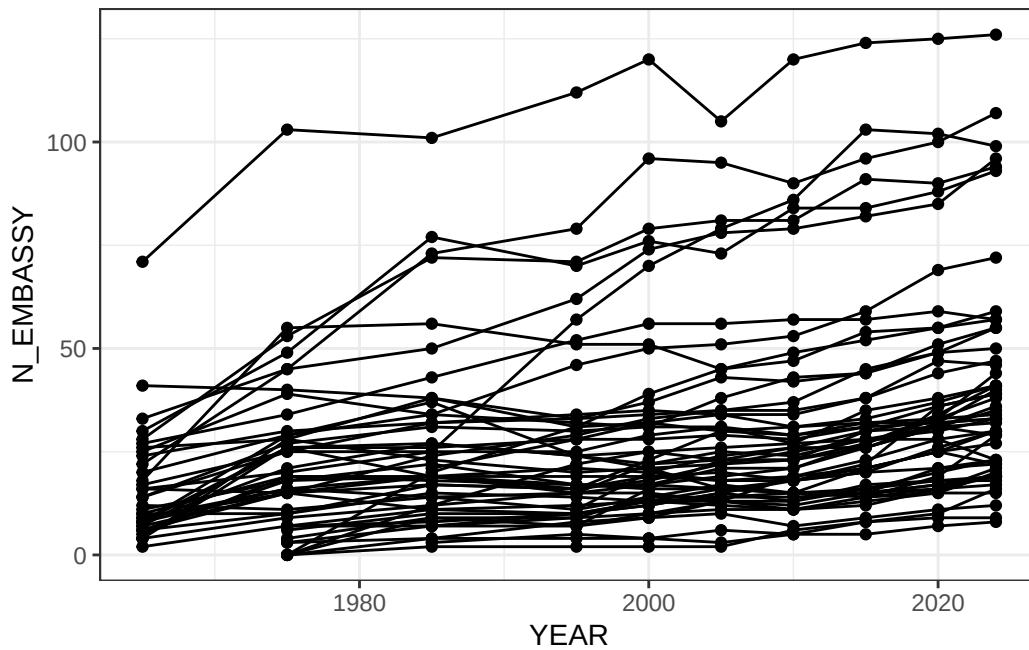

Below are the distributions of the three democracy variables.

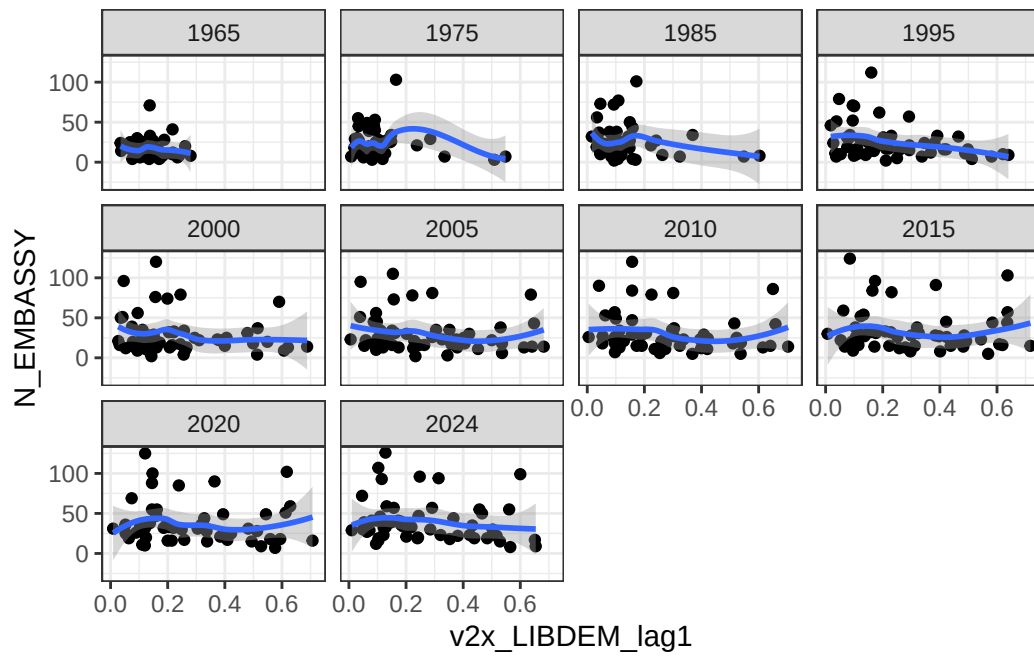

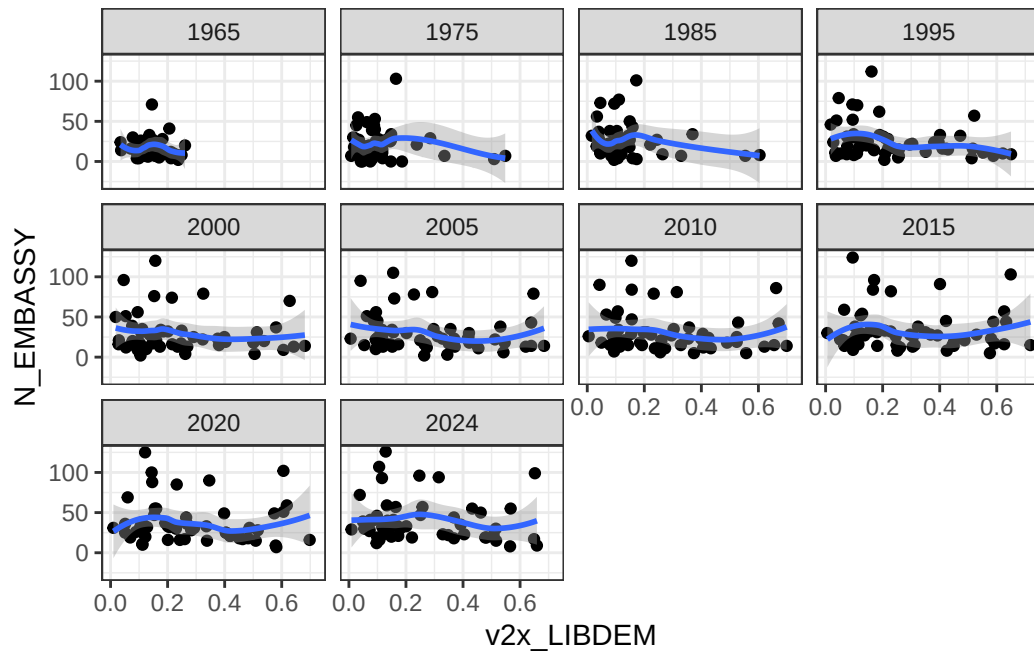

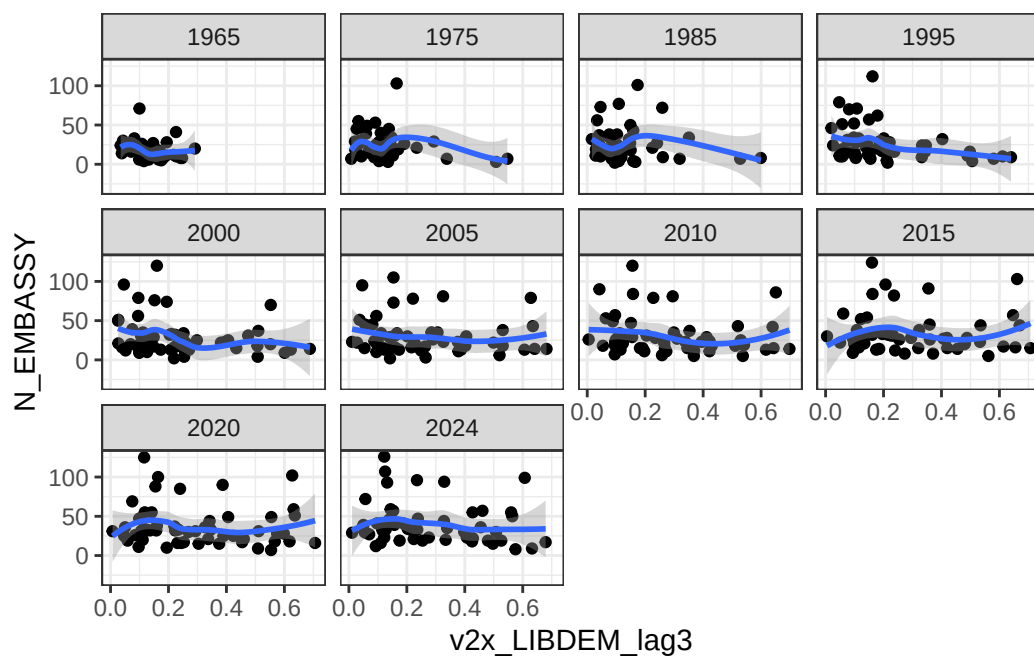

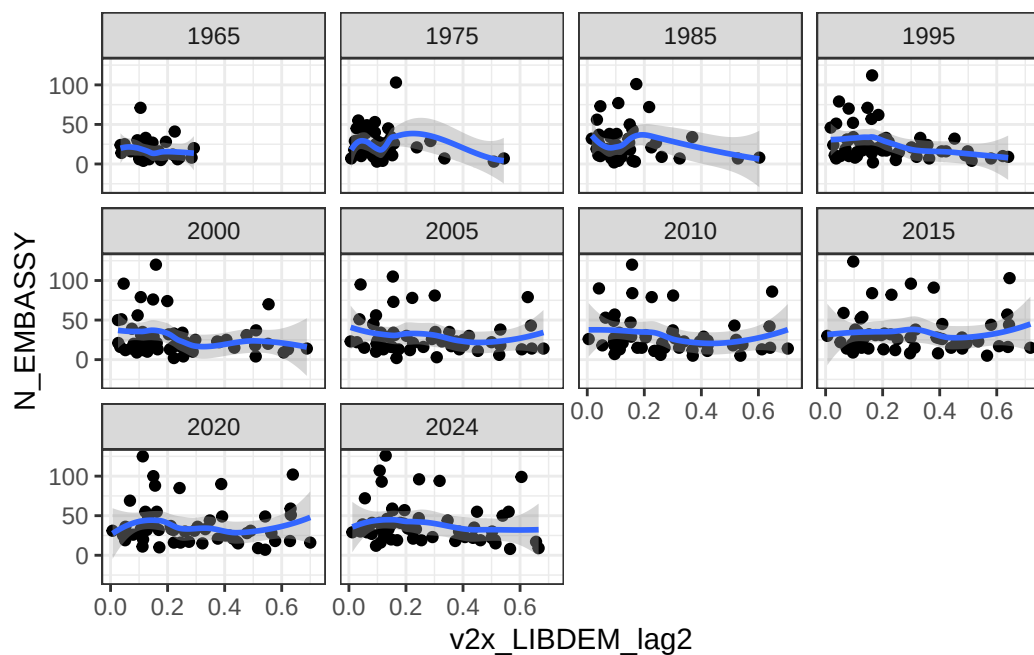

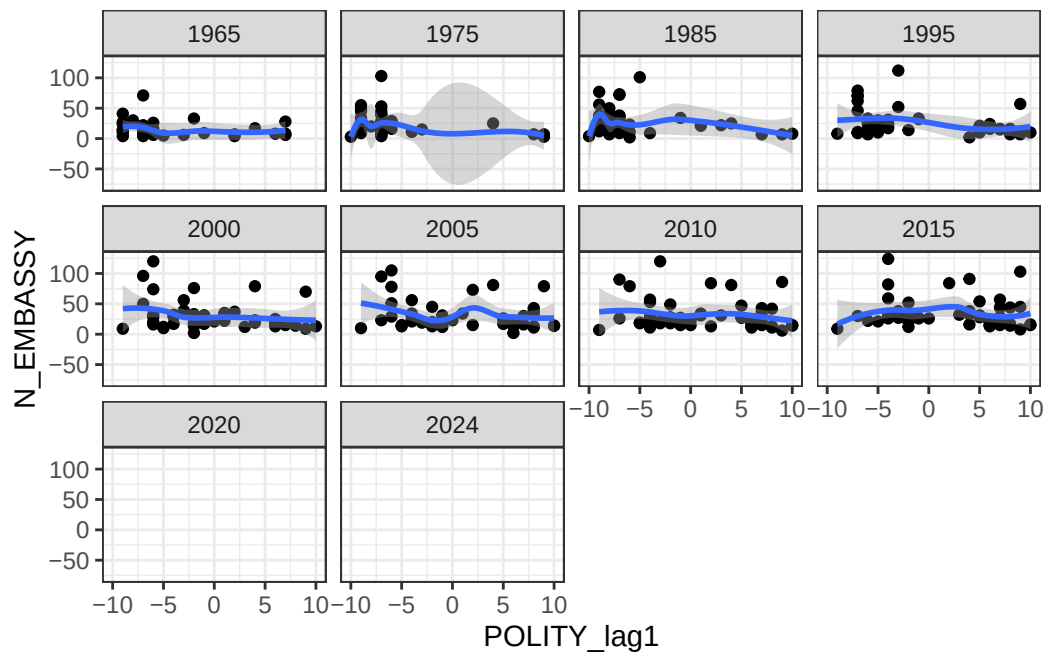

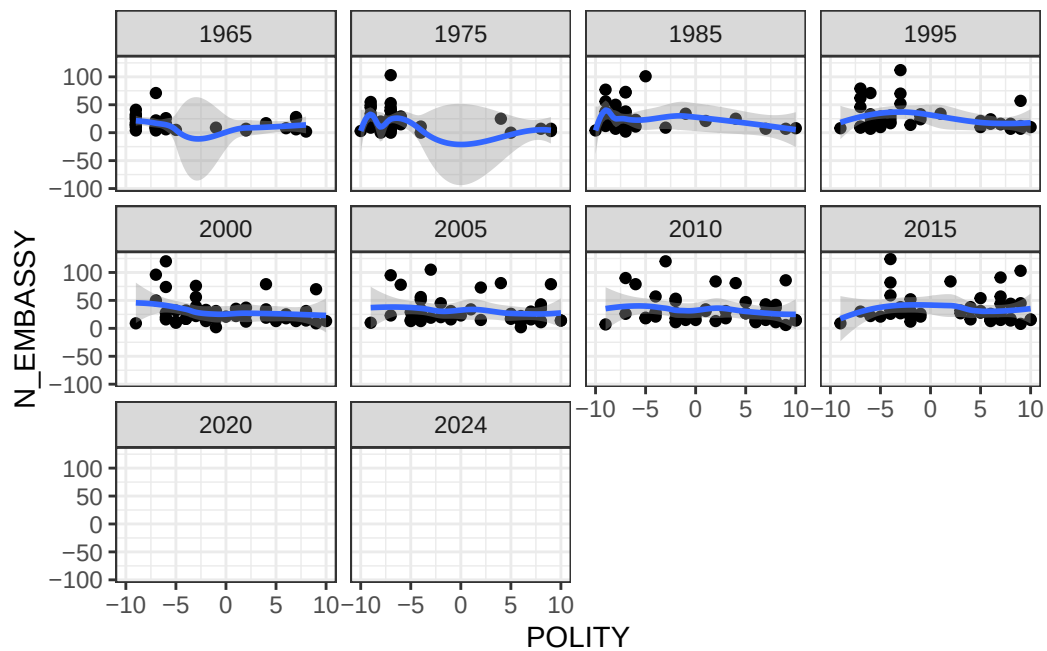

The plot below is the number of embassies over time with each connected line representing a single country.

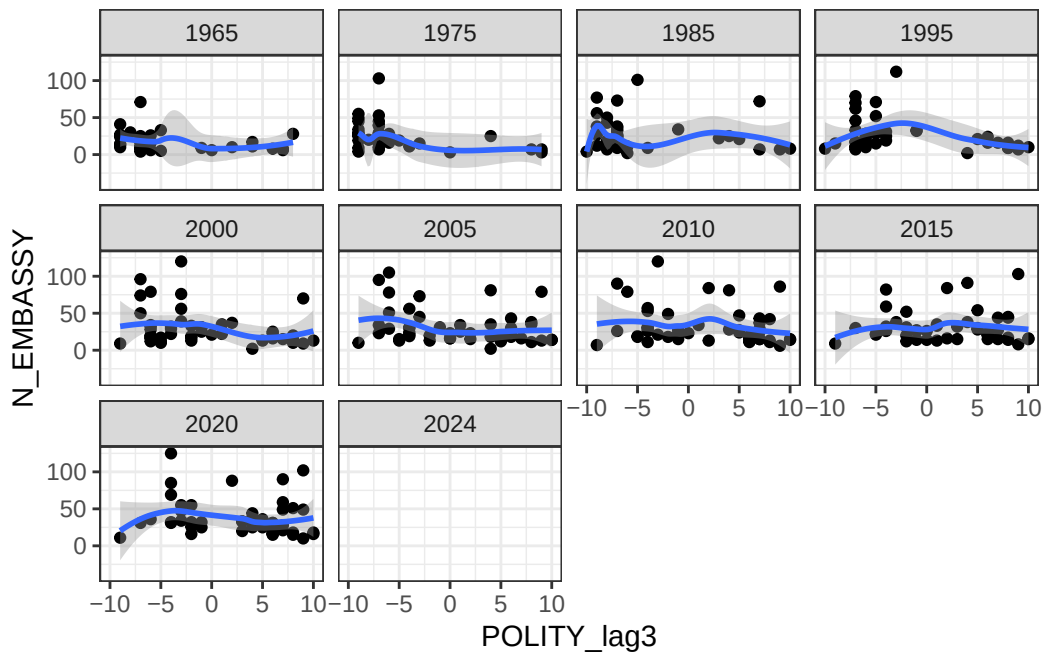

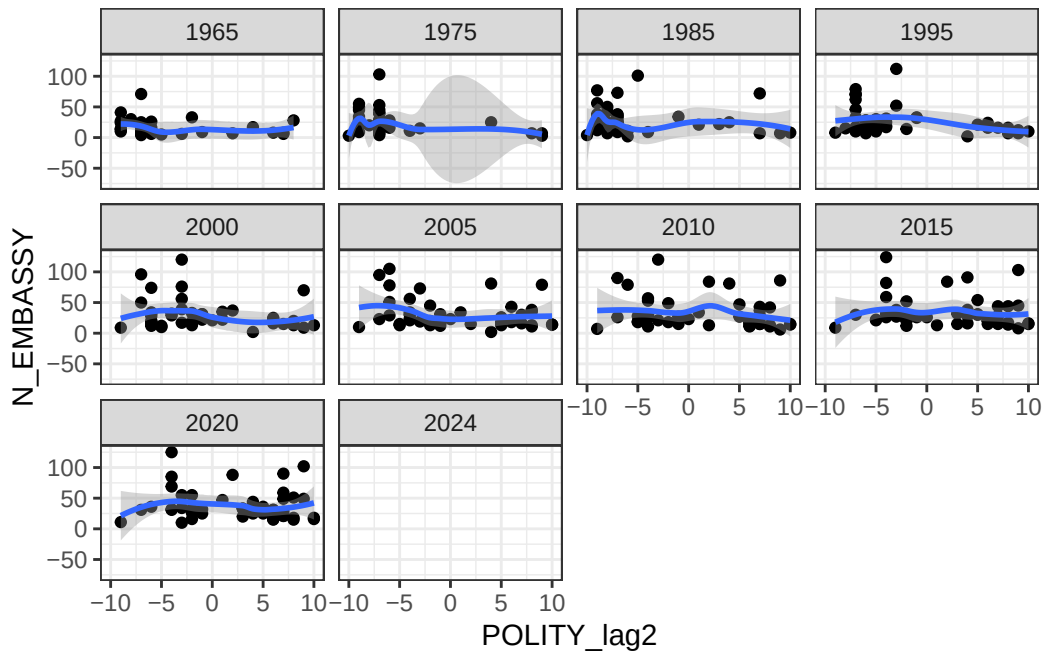

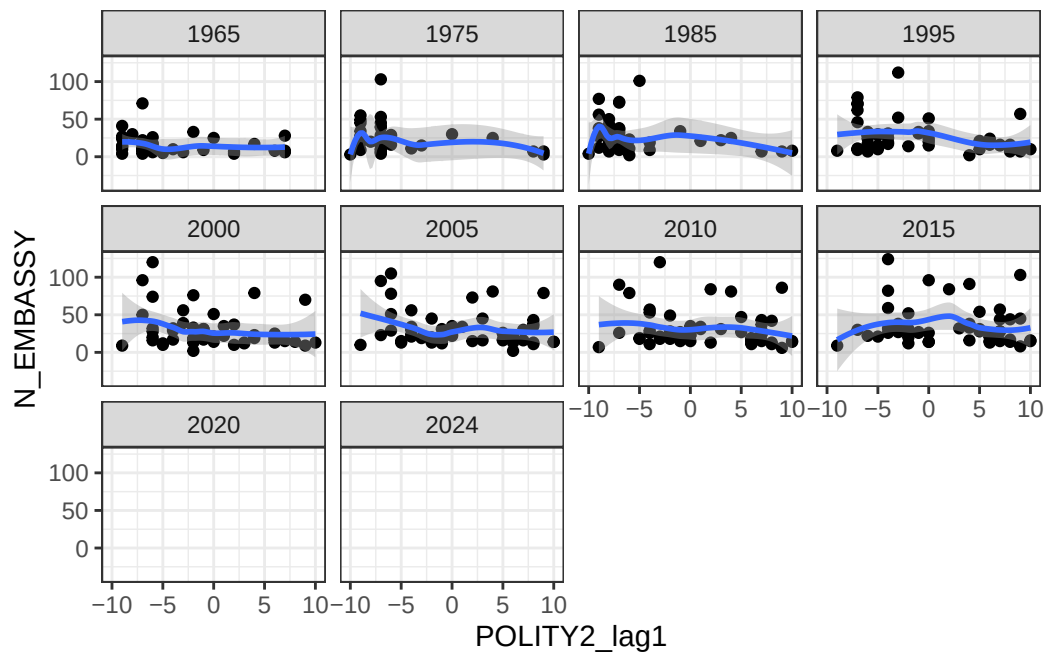

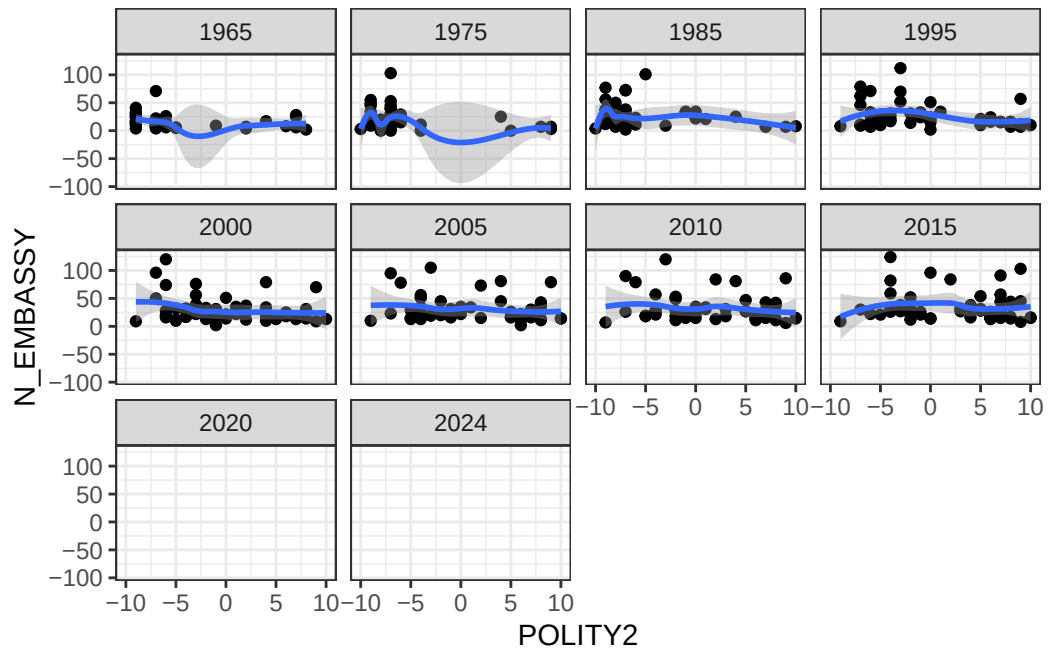

Next, scatter plots of the number of the democracy variables versus the embassies are plotted and each plot includes a trend line of the relationship.
